AMS Datahub

Whether you are a scientist, a citizen, student or what else; we all sometimes have great ideas. A bolt, out-of-the-box idea that potentially could improve the quality of our lives and our environment. Once you get that brilliant idea, you will probably investigate whether your idea is indeed brilliant and realistic.

Having a great idea in mind, first thing most do is browsing the internet for the information they need. However, there comes the challenge(!): where to find the right information? Modern technologies in a rapidly developing world lead to many and many information sources. The more there is to find on internet, the more difficult it appears to find the right information you're looking for. Quite often this leads to a delay or even cancelling of the implementation of your brilliant idea.

We as AMS want to help the people with brilliant ideas. Help them to investigate the potentials of their ideas and to accelerate the implementations of their idea. We see that one with a brilliant idea in mind is in need for specific information about the topic of the idea. This information can be in the form of **data** describing things. Sometimes we need **tools** to work with certain data/information and we might even need help of specialists to work with in order to convert data into relevant information. Also of great help and a source of inspiration is **knowledge** from experts, as learning from the **experiences** of others. A central place where data, tools, knowledge and experiences related to a specific topic of area can enable a faster and joyful way of implementing that brilliant idea one has in mind.

The AMS Datahub is our place where we want to help people exploring the potentials of their great ideas. A central place for development of great ideas in the Amsterdam metropolitan area!
